Fall 2019

Create a threat model. You can choose any system you like.

If you're stuck, I would suggest modeling an Internet-of-Things (IoT) system such as a smart light bulb or smart appliance, with an associated smartphone app and web site.

You won't know all the details of the system, of course, so make some guesses about a reasonable architecture.

Create a diagram like the ones you see in the reading. Include a list of threats, assets, and controls. Create the Traceability Matrix, making sure to include the threats and corresponding security controls.

Use the examples from your readings this week as a guide.

Submit your diagram and Traceability Matrix.
